

**STATE OF VERMONT**  
**BEFORE THE PUBLIC SERVICE BOARD**

<b>Investigation into Proposed Sale of</b>	)	
<b>Vermont Yankee Nuclear Power Station</b>	)	<b>Docket No. 6545</b>
<b>to Entergy Nuclear Vermont Yankee, LLC,</b>	)	
<b><u>and Related Transactions</u></b>	)	

**DIRECT TESTIMONY OF**  
**PAUL L. CHERNICK**  
**ON BEHALF OF**  
**THE DEPARTMENT OF PUBLIC SERVICE**

Resource Insight, Inc.

**JANUARY 7, 2002**

This Testimony Has Been Edited to Omit Confidential Information

*Summary: Mr. Chernick's testimony compares the value of the proposed sale to the value of other nuclear power-plant sales, and reviews the conduct of the auction, the follow-up to bidder offers, and the evaluation of the bids.*

## EXHIBITS

Exhibit DPS-PLC-1	<i>Professional Qualifications of Paul L. Chernick</i>
Exhibit DPS-PLC-2	<i>Valuation of Nuclear Asset Transfers</i>
Exhibit DPS-PLC-3	<i>Comparison of Regional Market Prices for Power</i>
Exhibit DPS-PLC-4	<i>Characteristics of Recent Northeastern Plant Sales</i>
Exhibit DPS-PLC-5	<i>Summary of Contracts Associated with Recent Nuclear Sales</i>

1    **I.    Identification and Qualifications**

2    **Q:    State your name, occupation and business address.**

3    A:    I am Paul L. Chernick. I am the president of Resource Insight, Inc., 347 Broad-  
4           way, Cambridge, Massachusetts 02139.

5    **Q:    Summarize your professional education and experience.**

6    A:    I received an SB degree from the Massachusetts Institute of Technology in June,  
7           1974 from the Civil Engineering Department, and an SM degree from the  
8           Massachusetts Institute of Technology in February, 1978 in technology and  
9           policy. I have been elected to membership in the civil engineering honorary  
10          society Chi Epsilon, and the engineering honor society Tau Beta Pi, and to  
11          associate membership in the research honorary society Sigma Xi.

12           I was a utility analyst for the Massachusetts Attorney General for more  
13          than three years, and was involved in numerous aspects of utility rate design,  
14          costing, load forecasting, and the evaluation of power supply options. Since  
15          1981, I have been a consultant in utility regulation and planning, first as a  
16          research associate at Analysis and Inference, after 1986 as president of PLC,  
17          Inc., and in my current position at Resource Insight. In these capacities, I have  
18          advised a variety of clients on utility matters. My work has considered, among  
19          other things, the cost-effectiveness of prospective new generation plants and  
20          transmission lines; retrospective review of generation planning decisions; rate-  
21          making for plant under construction; ratemaking for excess and/or uneco-  
22          nomical plant entering service; conservation program design; cost recovery for  
23          utility efficiency programs; the valuation of environmental externalities from

1 energy production and use; restructuring of electric and gas utilities; asset sales  
2 and mergers; and power supply arrangements. My resume is appended to this  
3 testimony as Exhibit DPS-PLC-1.

4 **Q: Have you testified previously in utility proceedings?**

5 A: Yes. I have testified approximately one hundred and eighty times on utility  
6 issues before various regulatory, legislative, and judicial bodies, including utility  
7 regulators in twenty-five states, New Orleans, the District of Columbia, and  
8 Ontario; the Federal Energy Regulatory Commission; the Atomic Safety and  
9 Licensing Board of the U.S. Nuclear Regulatory Commission; and various siting  
10 and environmental regulators. A detailed list of my previous testimony is con-  
11 tained in my resume.

12 **Q: Have you testified previously, in connection with regulatory review of the**  
13 **sale of power plants?**

14 A: Yes. I have testified on the sales of the fossil assets of Atlantic City Electric  
15 (New Jersey BPU Docket No. EM00020106), the multiple-owner Centralia coal  
16 plant to TransAlta (Utah PSC Docket No. 99-2035-03), and the Millstone  
17 nuclear power plant (Connecticut DPUC Docket No. 99-09-12RE01). My  
18 resume details this experience.

19 **Q: Have you testified previously before the Board?**

20 A: Yes. I testified in the following cases:

- 21 • Docket No. 4936, on Millstone 3;
- 22 • Docket No. 5270 on DSM cost-benefit test, pre-approval, cost recovery,  
23 incentives, and related issues;
- 24 • Docket No. 5330, on the conflict between the HQ purchase and DSM;

- 1       •     Docket No. 5491, on the need for HQ power and the costs of alternative
- 2             purchases;
- 3       •     Docket No. 5686, on the avoided costs and water-heater load-control
- 4             programs of Central Vermont Public Service (CVPS);
- 5       •     Docket No. 5724, on CVPS avoided costs;
- 6       •     Docket No. 5835, on design of CVPS load-management rates;
- 7       •     Docket No. 5980, on electric-industry restructuring and avoided costs;
- 8       •     Docket No. 5983, on the prudence of Green Mountain Power's decisions
- 9             regarding the HQ contract, avoided costs, and distributed utility planning;
- 10      •     Docket No. 6018, on the prudence of CVPS's decisions regarding the HQ
- 11             contract, avoided costs, and distributed utility planning;
- 12      •     Docket No. 6107, on the prudence of GMP's decisions regarding the HQ
- 13             contract and distributed utility planning;
- 14      •     Dockets Nos. 6120 and 6460, on the prudence of CVPS's decisions
- 15             regarding the HQ contract.

16   **Q: Have you been involved in other aspects of utility planning and regulation**  
17   **in Vermont?**

- 18   A: Yes. My other activities have included the following
- 19       •     participation in the CVPS and Vermont Gas DSM collaboratives;
  - 20       •     preparation of testimony on the avoided costs of Green Mountain Power
  - 21             in Docket No. 5780, not presented due to settlement of the case;
  - 22       •     assisting the Department of Public Service (DPS or the Department) in the
  - 23             power-supply negotiations of the externalities investigation;
  - 24       •     providing consulting support to the Vermont Senate on stranded costs and
  - 25             Vermont Yankee economics;

- 1           •     assisting the Burlington (Vermont) Electric Department on distributed
- 2                 utility planning;
- 3           •     assisting the Department in the statewide collaborative on distributed
- 4                 utility planning.

5     **Q: Are you the author of any publications on utility planning and ratemaking**  
6         **issues?**

7     A: Yes. I am the author of a number of publications on rate design, cost allocation,  
8         power-plant cost recovery, conservation-program design and cost-benefit analy-  
9         sis, and other ratemaking issues. These publications are listed in my resume.

10    **II. Introduction**

11    **Q: On whose behalf are you testifying in this proceeding?**

12    A: I am testifying on behalf of the Vermont Department of Public Service.

13    **Q: What is the purpose of this testimony?**

14    A: I address four subjects related to the sale of the Vermont Yankee nuclear power  
15         plant by its current owner, the Vermont Yankee Nuclear Power Corporation  
16         (VYNPC), to Entergy Nuclear Vermont Yankee (ENVY). First, I compare the  
17         proposed sales price for Vermont Yankee to prices of other nuclear plants sold  
18         for operation in the competitive market. Second, I review the auction process.  
19         Third, I review the follow-up by J.P. Morgan and Vermont Yankee regarding the  
20         options offered by ENVY in its bid. Fourth, I review the evaluation of the final  
21         bids for the plant, conducted by J.P. Morgan on behalf of VYNPC.

22                 I address these subjects in response to Issue 1 specified by the Board with  
23         respect to the proposed transfer, in its 11/5/2001 Order Re: Scope And Schedule

1 (4): "A review of the sponsors' bid solicitation and negotiation processes, to  
2 consider whether their conduct has maximized the benefits of the transfer to  
3 ratepayers and the state as a whole."

4 **Q: What do you conclude from your comparison of the proposed price for**  
5 **Vermont Yankee to the sales prices of other nuclear plants?**

6 A: There are no close comparables to the proposed sale of Vermont Yankee. The  
7 value of the proposed transaction is toward the bottom of the range of other  
8 recent nuclear sales. The relatively low price for Vermont Yankee may be  
9 explained, in whole or in part, by its age and size, and may be reasonable when  
10 compared to other recent transactions.

11 **Q: What are your conclusions regarding the auction process?**

12 A: It is difficult to evaluate the management of an auction process from documents  
13 alone, since the effectiveness of the auction depends on the quality of communi-  
14 cations between the participants and the auction manager.

15 With those limitations in mind, J.P. Morgan appears to have structured the  
16 auction in an appropriate manner. I have not identified any problems in the  
17 operation of the auction. Nonetheless, .....  
18 .....

19 **Q: What are your conclusions regarding the performance of J.P. Morgan and**  
20 **VYNPC in following up on the .....?**

21 A: J.P. Morgan and VYNPC did not determine the costs and benefits of .....  
22 ....., and did not follow up on ..... with  
23 further discussion or negotiation. It is not clear whether .....  
24 would have ultimately added to the value of the transaction to the sponsors. As  
25 a result, the question that the Board raised in Issue 1 in its order of November

1           5, 2001, “whether their conduct has maximized the benefits of the transfer,”  
2           cannot be answered.

3     **Q: What are your conclusions regarding J.P. Morgan’s evaluation of the final**  
4     **bids for Vermont Yankee?**

5     A: J.P. Morgan included all the components of value that varied among the offers.  
6           With a few exceptions, J.P. Morgan appears to have reasonably modeled those  
7           components.

8                 As I explain in §VI below, the exceptions occur in the modeling of the  
9           purchased-power agreement, where several of J.P. Morgan’s assumptions and  
10          methods are either questionable or incorrect.

### 11     **III. Comparable Sales Analysis**

#### 12     **A. The Basis for Valuation**

13     **Q: How are the sales prices for nuclear plants generally expressed?**

14     A: There is a great deal of variation in the form in which the value of a nuclear  
15          plant sale may be stated.<sup>1</sup> The value of the sale certainly includes any cash  
16          payment for the plant at the time of closing. In addition, various reports of the  
17          sales value of nuclear assets include the following components:

- 18                 • cash for materials and fuel;
- 19                 • deferred payments for plant, materials, and fuel, often structured as a note
- 20                 from the buyer to the seller;

---

<sup>1</sup>Many of the same issues arise in the sale of non-nuclear generating assets. Some issues are unique to nuclear assets (such as decommissioning).

- 1       •   reduction in the seller's potential liability for nuclear decommissioning;
- 2       •   the difference (which may be positive or negative) between projected
- 3           market power prices and the price of a plant-contingent purchased-power
- 4           agreement (PPA) from the plant buyer to the seller;
- 5       •   the expected value of a revenue-sharing agreement, under which the buyer
- 6           will pay the seller a fraction of the plant's revenue, if market prices rise
- 7           above a target level;
- 8       •   payment by the seller to "top off" nuclear decommissioning funds, often
- 9           to the minimum level required by the NRC for nuclear plants that are not
- 10          subject to cost-of-service regulation;
- 11       •   other fixed or contingent payments, such as (a) sharing of property-tax
- 12           payments and refunds, (b) sharing of insurance refunds, (c) bonuses if the
- 13           buyer also acquires other nearby plants, (d) sharing of O&M costs during
- 14           some transition period.

15   **Q: Does this accounting for the sales value reflect the total benefit to the seller,**  
16   **or the total cost to the buyer, from the transaction?**

17   A: Not necessarily. The value of the sales transaction does not usually include all  
18   the ongoing costs and benefits of the transaction. The seller, for example, saves  
19   the O&M, property taxes, and insurance associated with the plant, but loses the  
20   value of its energy and capacity. The buyer assumes the O&M, property taxes,  
21   and insurance, and gains the revenues from the plant's output.

22           Thus the reported value of nuclear sales is often greater than the cash  
23   payment for the plant, but is not the same as a full accounting of costs and  
24   benefits for either the seller or buyer.

1    **Q: Are there any complications in interpreting the value of a nuclear**  
2    **transaction?**

3    A: Yes, numerous such complications and ambiguities arise with respect to nearly  
4    every aspect of nuclear transactions, other than the cash price for the plant itself.

- 5       • Some tabulations of nuclear sales do not include the cash payments for  
6       nuclear fuel and materials as part of the plant value. The irradiated fuel has  
7       little or no value (or perhaps a negative value, for storage and disposal  
8       costs), and the materials have little value without the plant. Consequently,  
9       payments for these items should be considered payments for the plant.
- 10      • In transactions that include delayed payments, those payments may be  
11      presented at their nominal value (without discounting for the delay), or  
12      discounted at a discount rate. The discount rate may be derived from the  
13      sales agreement (such as the interest rate on any notes issued for delayed  
14      payments), representing the seller's cost of capital, or representing the  
15      buyer's cost of capital.<sup>2</sup>
- 16      • The benefit to the seller of reducing its decommissioning liability may be  
17      measured against what it already has in its decommissioning fund (in  
18      which case any top-off payment is a cost), the NRC's generally lower  
19      funding targets, the utility's generally higher estimate of decommissioning  
20      costs at the end of the plant's license, or the still higher cost of unplanned  
21      early decommissioning (which seemed to be a real possibility for Pilgrim  
22      and Oyster Creek prior to their sale).

---

<sup>2</sup>In principle, the discount rate could reflect the inherent risk in the particular cash flow. I have not seen any nuclear sale valuation that used an explicitly risk-adjusted discount rate.

- 1           • Similarly, estimates of the timing of decommissioning vary from next year  
2           or next refueling, to well beyond the end of the current license life. Valuing  
3           a sale as if it avoided the seller buying for immediately shutting down and  
4           dismantling the plant will produce a much higher valuation of the  
5           transaction than would an analysis that assumes a long life, orderly  
6           shutdown, and delayed decommissioning.
- 7           • The value of PPAs and Revenue-Sharing Agreements (RSAs) depend on  
8           the expected value of future power prices; the value of an RSA also  
9           depends on the distribution of prices around the expected value.<sup>3</sup>
- 10          • Some nuclear sales provide that the buyer will flow through to the seller  
11          the return of payments the seller made previously, such as for outage  
12          insurance or for disputed property taxes. Whether this is regarded as an  
13          additional benefit to the seller depends on whether the payment stream is  
14          thought of as part of the plant, or as already belonging to the seller.
- 15          • Some transactions include hard-to-value non-cash components (such as the  
16          coal plants Duquesne-FirstEnergy swapped for nuclear shares).
- 17          • Some terms of nuclear deals are not fully public. For example, GPU  
18          disclosed that its agreement to sell its Three Mile Island 1 unit to AmerGen  
19          included an RSA, and the maximum benefit from the RSA, but did not  
20          disclose such details as the strike price at which the RSA would take effect.
- 21          As a result, the same information about a nuclear-plant sale can produce  
22          widely different valuations of the transaction, depending on the assumptions  
23          made about future decommissioning costs, market prices, and other factors.

---

<sup>3</sup>In a typical revenue-sharing agreement, the buyer pays the seller a percentage of the difference between the actual market price and a predetermined reference price, times the plant's output.

1    **Q: How have you dealt with these uncertainties and complications?**

2    A: I include a range of available estimates for PPAs, decommissioning, and other  
3       adjustments.<sup>4</sup> Exhibit DPS-PLC-2 lists the nuclear sales and for each provides  
4       some information (capacity, percentage of each unit, life remaining on the NRC  
5       operating license) and the values of the sales, interpreted in multiple ways.

6    **Q: Are any broad trends evident in the data in Exhibit DPS-PLC-2?**

7    A: Yes. There is a clear split between the sales that were announced prior to January  
8       2000, and those after that date. The earlier group comprises the following nine  
9       sales and two proposed sales:

- 10       • Two small, old single-unit plants (Pilgrim and Oyster Creek), which are in  
11         some ways comparable to Vermont Yankee.
- 12       • Two larger, newer single-unit plants (Clinton, TMI 1).
- 13       • Five sales of minority portions of one or more plants (Montaup's sale of its  
14         Seabrook share, the transfer of the bankrupt Cajun Coop's share of River  
15         Bend to Entergy, Duquesne's sale of Beaver Valley and Perry, and  
16         Conectiv's sale of Hope Creek and Salem to PSEG Power and of Peach  
17         Bottom to both PSEG Power and Excelon).
- 18       • Two sales to AmerGen announced in 1999, but never consummated: the  
19         original proposal to sell Vermont Yankee, and the proposal of NiMo and  
20         NYSEG to sell Nine Mile Point 1 and their shares of Nine Mile Point 2.

---

<sup>4</sup>Some of the values of reduced decommissioning payments are from J.P. Morgan's discovery responses. Mr. Dabbar asserts that "JP Morgan uses press releases, 8Ks, and other public documents when compiling its comparable transactions statistics," but that "These documents are not saved by JP Morgan." (VY:DPS:2-73)

1     **Q: How useful are these early sales in evaluating the price ENVY has offered for**  
2     **Vermont Yankee?**

3     A: These sales are of limited relevance, for several reasons.

4             First, in the early years of restructuring (1996–1999), the general  
5     perception was that most nuclear plants were of little value, O&M costs would  
6     continue to be high, capacity factors would remain low, market prices for  
7     electric energy would be low, and that the issues of risk, spent-fuel disposal and  
8     decommissioning would result in negative net values for most plants. Much of  
9     the perceived value in the sales lay in the elimination of risk of operating and  
10    decommissioning costs.

11            Second, several of the early sales were of minority shares (sold by  
12    Montaup, Conectiv, Duquesne, and Cajun). Minority shares are often less  
13    valuable than controlling shares, and especially less than 100% ownership, for  
14    two reasons. Minority owners generally have little voice in the operation of a  
15    power plant. Since the value of a nuclear plant depends critically on how well  
16    it is operated, and the potential purchasers clearly believe they are able to  
17    operate plants reliably and economically, potential purchasers may not be much  
18    interested in owning a small portion of a plant controlled by someone else.

19            Minority ownership is also less valuable, because the co-owners of power  
20    plants generally possess the right of first refusal.<sup>5</sup> It is widely recognized that the  
21    existence of a right of first refusal can depress the price of assets sold at auction.

---

<sup>5</sup>A right of first refusal generally provides that, should any participant decide to sell its share, each other participant has the right to match any offer that the seller may accept from a third party. Among other things, these provisions assure the participants in the enterprise that they can choose to increase their share, rather than deal with a new and perhaps undesirable associate.

1       As a witness for Northeast Utilities in the Connecticut proceeding on the sale  
2       of Millstone, said:

3           A right of first refusal possessed by a third party could lower the value of  
4           an asset to be sold in an auction. Prospective bidders may be less likely to  
5           spend the necessary resources in preparing a bid for an asset where there  
6           is a high likelihood that a third party will exercise this right. Consequently,  
7           there could be fewer and less serious bidders and thus theoretically a  
8           tendency for auction prices to be lower.<sup>6</sup>

9           In other words, a bidder will tend to be less aggressive in its bidding if it  
10       knows that, should it get a good price, a co-owner can take the asset away for  
11       the same price. Rights of first refusal have been invoked at least twice in the sale  
12       of power plants:

- 13       •   In November 1998 Pacific Gas and Electric selected FPL Group to purchase  
14           its Geysers geothermal capacity. In January 1999 the minority owner of the  
15           steam field (Calpine) bought out the majority owner and exercised its joint  
16           right of first refusal, acquiring the plants at the price negotiated by FPL.
- 17       •   In June 1999 Niagara Mohawk attempted to sell its shares of Nine Mile  
18           Point 1 and 2 (100% and 41%, respectively) and NYSEG's 18% share of  
19           Unit 2 to AmerGen through an exclusive negotiation process. This attempt  
20           failed when Rochester Gas & Electric, owner of 14% of Unit 2, exercised  
21           its right of first refusal. While Rochester Gas & Electric would be the  
22           nominal purchaser, it had partnered with Entergy, which would assume  
23           responsibility for funding the acquisition and operating the plant, and  
24           would assume all associated risks. The sale was subsequently cancelled.

---

<sup>6</sup>Robert T. McWhinney, President and Chief Executive Officer of Stone & Webster Management Consultants, CDPUC Docket 99-09-12, in response to OCC-021.

1 All of the sales of minority shares of nuclear plants have been to joint  
2 owners. These sales cannot be considered to be fully competitive.

3 Third, some of the early nuclear sales involved non-cash values that are  
4 difficult to quantify. The most striking case is that of Duquesne, which traded  
5 minority shares in several coal units, as well as in three nuclear units, for sole  
6 ownership of several coal units of various vintages. The valuation of the nuclear  
7 assets depends on the value assumed for both the minority coal-plant shares and  
8 the wholly owned coal plants.

9 **Q: What was the second group of nuclear sales?**

10 A: Since January 2000, the following five sales have been announced:

- 11 • NYPA's sale to Entergy of its Fitzpatrick and Indian Point 3 nuclear power  
12 plants.
- 13 • The re-auctioning of the Nine Mile Point units, including all of Unit 1 and  
14 82% of Unit 2, resulting in their sale to Constellation.
- 15 • Con Edison's sale of the Indian Point 2 unit to Entergy.
- 16 • The sale of Millstone 2 and 93.5% of Millstone 3 by Northeast Utilities to  
17 Dominion.
- 18 • The proposal of Southern California Edison to sell its 16%, 590 MW share  
19 of the Palo Verde nuclear plant in Arizona and its 48% 710 MW share of  
20 the coal-fired Four Corners plant in New Mexico to Pinnacle West.  
21 Pinnacle is the holding company for Arizona Public Service, which is a  
22 part owner and operator of both plants.

23 The proposal in this proceeding to sell Vermont Yankee constitutes the  
24 sixth proposed sale since January 2000. The auction of Seabrook is under way.

1     **Q: How useful are these later sales in evaluating the price ENVY has offered for**  
2     **Vermont Yankee?**

3     A: The first four sales on the post-2000 list, above, are more relevant to the current  
4     proposal than are the earlier sales. They represent recent expectations regarding  
5     decommissioning liabilities, nuclear performance and electric market prices.

6             Vermont Yankee's location is comparable or superior to the units in the  
7     other recent Northeastern nuclear sales. Millstone is in New England, and  
8     market prices would tend to be similar for Vermont Yankee and Millstone. The  
9     Fitzpatrick and Nine Mile plants are located in western New York State, where  
10    market prices tend to be lower than in New England. These regional market-  
11    price differences are illustrated in Exhibit DPS-PLC-3.

12            The NYPA sale was the result of an exclusive negotiation with Entergy,  
13    rather than an auction. An unsolicited bid from Dominion resulted in Entergy's  
14    improving its bid somewhat, but the price may have been depressed by the lack  
15    of full competition.

16            On the other hand, there are factors that would tend to increase the value  
17    per kilowatt of at least some of these other Northeastern nuclear plants relative  
18    to Vermont Yankee.

- 19       • The individual units are larger, ranging from 610 MW for NMP 1 and 820  
20       MW for FitzPatrick, to over 1,000 MW for Millstone 3 and NMP 2,  
21       compared to Vermont Yankee's 510 MW. Larger generators tend to have  
22       lower O&M costs per kilowatt.
- 23       • Nine Mile Point and Millstone each have two operating units on the same  
24       site. While each of the NYPA plants was nominally a single unit, Indian  
25       Point 3 is adjacent to Indian Point 2; when Entergy was bidding on the

1           latter unit, it was essentially bidding to acquire a two-unit plant. Multiple  
2           units on a site share costs, which tends to make them less expensive to  
3           operate than single-unit plants, on a dollar-per-kilowatt basis.<sup>7</sup>

4           • Other than Nine Mile 1, the other units are all younger than Vermont  
5           Yankee, giving them more years of operation before they face relicensing.  
6           Their more-recent designs may be easier and less expensive to relicense.  
7           Age, size, and siting differences are summarized in Exhibit DPS-PLC-4.

8    **Q: Please describe the attempt to sell Palo Verde.**

9    A: Southern California Edison attempted to sell its share of Palo Verde together  
10   with its share of Four Corners. Initially, the utility negotiated a sales price for  
11   its shares in the two plants to Pinnacle West. The agreement with Pinnacle West  
12   allowed other parties to make competing offers for Four Corners, or for the two  
13   plants together, but did not allow bids for Palo Verde separately from Four  
14   Corners, and gave Pinnacle West the right of first refusal for any bid.

15           An alternative bid was received for Four Corners, but not for the two  
16   plants together. The transaction never closed, due to the rapid escalation of elec-  
17   tricity prices in the West and a legislative prohibition on generation-asset sales.

18           The peculiar nature of the Palo Verde auction, the minority status of  
19   Southern California Edison's share, and the prohibition on competing bids for  
20   the nuclear assets without the coal plants, as well as the prospect of legislation  
21   banning the sale, may all have discouraged bidders and reduced the bid price.

---

<sup>7</sup>Part of the extra value of a two-unit site is reflected in Entergy's purchase agreement with NYPA, which provided for an additional \$25 million payment if Entergy acquired Indian Point 2, and a similar payment if Entergy acquired Nine Mile Point, which is adjacent to FitzPatrick.

1                   Nonetheless, Pinnacle West offered more cash per kW for Palo Verde  
2                   capacity than Entergy has offered for Vermont Yankee.

3    **B.   Valuation of Past Sales**

4    **Q:   What range of valuations have you estimated for the early group of nuclear**  
5           **sales?**

6    A:   Most of the sales announced prior to 2000 were for prices in the \$100/kW–  
7           \$200/kW range, although some were lower and some—depending on the  
8           interpretation of the decommissioning costs and the valuation of the Duquesne  
9           coal plants—may have been worth more than \$500/kW.

10   **Q:   What range of valuations do you estimate for the more-recent sales?**

11   A:   The post-1999 nuclear sales included \$322/kW to \$779/kW in cash and/or notes,  
12           expressly for plant, fuel and materials and supplies. In addition,

- 13           •   The NYPA sale included a PPA (which NYPA considered to be at market  
14               prices) to cover NYPA's remaining contract obligations for power from each  
15               unit, plus another lower-priced PPA for uncommitted power from Fitz-  
16               Patrick for four years, plus payment streams designated as being related to  
17               repaying NYPA's decommissioning contribution and for compensating  
18               NYPA for entering into the second FitzPatrick PPA, an RSA, and bonus  
19               payments if Entergy acquired NMP or Indian Point 2.
- 20           •   The Indian Point-2 sale included a PPA that Con Edison has described as  
21               being below market price, as well as sharing of the savings from deferred  
22               decommissioning (Order in NYPSC Case 01-E-0040 (August 31, 2001):6).

- 1           •     The Nine Mile Point sale included PPAs covering 90% of plant output for  
2                     the remaining license life of Unit 1 and 10 years of Unit 2, as well as an  
3                     RSA for Unit 2 for the subsequent 10 years.

4                     Exhibit DPS-PLC-5 summarizes these payments.

5                     Including the present value to the seller of all these other cash-flow  
6                     streams, the values of the sales rise to roughly \$400–\$900/kW. For at least some  
7                     of the sales, reduction in decommissioning obligations may add to the value.

8     **Q:   How do these prices compare to the price Entergy has offered for Vermont**  
9     **Yankee?**

10    A:   The cash portion of the proposed Vermont Yankee sale is \$353/kW, which would  
11           be towards the bottom of the range of recent sales, comparable to the prices for  
12           the NYPA plants and for NMP 1. Both NMP and NYPA's FitzPatrick are in  
13           western New York, where energy prices are lower. Also, NYPA's sale was not  
14           fully competitive.

15                    If one accepts the value of the PPA estimated by J.P. Morgan, the value of  
16                    the Vermont Yankee sale would rise to almost \$700/kW, towards the high end  
17                    of the range of sale values (including all cash flows except avoided  
18                    decommissioning). As I explain below, and as discussed in more detail in the  
19                    testimony of DPS Witness Bruce Biewald, J.P. Morgan has overestimated the  
20                    value of the Vermont Yankee PPA. Using the corrected costs and benefits  
21                    supported by DPS witnesses Biewald, Schlissel and Sherman, the Vermont  
22                    Yankee transaction value is under \$400/kW. The LMA would also add some  
23                    additional value to the transaction.

24    **Q:   What do you conclude from your comparison of the proposed price for**  
25    **Vermont Yankee to the sales prices of other nuclear plants?**

1     A:   In the analysis I describe above, the value per kilowatt offered for Vermont  
2           Yankee in the proposed transaction appears to be at the bottom of the range of  
3           recent nuclear sales. However, as I discuss above, the determination of the  
4           value of these transactions is inherently imprecise. In addition, the other recent  
5           sales are not closely comparable to the proposed sale of Vermont Yankee,  
6           which is a single 510 MW unit from the early 1970s, while other recent sales are  
7           predominately of larger multi-unit plants from the late 1970s and 1980s.  
8           Overall, considering the differences between the characteristics of  
9           Vermont Yankee and the plants in the other recent sales, the price proposed in  
10          this transaction may be reasonable when compared to other recent transactions.<sup>8</sup>

#### 11    **IV. Review of Auction Process**

12    **Q: What aspects of the auction process did you review?**

13    A:   I reviewed the documentation provided by J.P. Morgan and Vermont Yankee  
14          regarding the following aspects of the auction:  
15          

- 16           • potential bidders contacted
- 17           • the structure of the auction
- 18           • the encouragement and support of potential and actual bidders through the  
19            auction process
- arrangements for due diligence by final bidders

---

<sup>8</sup> This conclusion is consistent with the findings of Monika Eldridge in Docket No. 6300. Using a different methodology, and an older market-price forecast, she found that the final price proposed by AmerGen resulted in “a similar or slightly lower price-to-value ratio than the latest nuclear asset transactions, and the price being offered by AmerGen Vermont is fair and reasonable.” (Supplemental pf, 12/15/2000, at 3).

1           •     the decision to proceed to final negotiations.

2                 Most of these activities were actually undertaken by J.P. Morgan.

3     **Q: Did J.P. Morgan contact an appropriate group of potential bidders?**

4     A: J.P. Morgan appears to have contacted all the parties that would have been likely  
5         to bid on Vermont Yankee, as follows.

6           •     .....

7           •     .....

8                 .....

9                 .....

10                .....

11                .....

12          •     .....

20                .....

---

.....  
.....  
.....  
.....  
.....

1 .....  
2 .....  
3           The auction was extensively reported (as was AmerGen's previous attempt  
4           to purchase the plant), so it is unlikely that any potential bidder was unaware of  
5           the auction.

6   **Q: Was the auction structured reasonably?**

7   A: J.P. Morgan appears to have followed the standard design for auctions of  
8           generation assets.

9           In many auctions, non-binding indicative bids are requested, to assess the  
10          level of interest of bidders and, in multiple-asset auctions, assist in defining  
11          bundles of assets for the binding bids. I do not believe that the omission of this  
12          step in the Vermont Yankee auction sacrificed much information of value.

13   **Q: How did J.P. Morgan perform in encouraging and supporting bidders?**

14   A: This aspect of the auction is particularly difficult to review. J.P. Morgan has not  
15          provided a detailed paper trail of its interactions with potential bidders.

16 .....  
17 .....  
18 .....

19   **Q: Is it clear what happened to the other potential bidders?**

20   A: .....  
21 .....  
22 .....  
23 .....  
24 .....  
25 .....

2 .....  
3 .....  
4 .....  
5 .....  
6 .....  
7 .....  
8 .....  
9 .....  
10 .....

11 **Q: Were the arrangements for due diligence adequate?**

12 A: J.P. Morgan seems to have provided a large amount of data and made additional  
13 documents and plant inspections available. I cannot determine from the  
14 information provided whether

15 .....  
16 .....  
17 .....  
18 .....  
19 .....  
20 .....

21 **Q: Did J.P. Morgan and VYNPC properly handle the decision to proceed to final**  
22 **negotiations?**

23 A: The critical issue here was .....  
24 .....  
25 .....

1 .....  
2 .....  
3 .....  
4           Whatever flaws it might have had, the auction produced a substantial bid.  
5           I see no reason for J.P. Morgan and VYNPC to have abandoned the auction  
6           process at that point. They properly identified the high bidder; proceeding to  
7           final negotiations offered the best hope for the highest price, given the  
8           circumstances at that time (late July 2001).

9   **V. Follow-Up to Alternative Offers in Bids**

10 **Q: What alternative terms were offered by the bidders?**

11 A: The Entergy Bid Letter offered to .....

8 **VI. The Bid-Evaluation Process**

9 **Q: What bids did J.P. Morgan evaluate for VYNPC?**

10 **A:** .....:  
11 ..... 14  
12 .....  
13 .....  
14 .....  
15 .....  
16 .....  
17 .....  
18 .....

---

<sup>14</sup>The output of Vermont Yankee covered by the PPA does not include any output made possible by increasing the plant's capability.

.....  
.....

1 .....  
2 .....  
3 .....  
4 .....  
5 .....

6 **Q: Did J.P. Morgan properly evaluate the alternative bids?**

7 A: The numerical evaluations of the bids included all of the readily quantifiable  
8 elements of value: cash for the plant, fuel, and materials and supplies; the  
9 present value of the PPA, including an attempt to value the LMA; required  
10 VYNPC contribution to employee pension funding; and the present value of  
11 payments .....

12 ..... The  
13 inputs to these numerical evaluations, such as the discount rate used to present-  
14 value the PPA, are generally appropriate, with the exception of the PPA.

15 **Q: What were the problems in J.P. Morgan's valuation of the PPA?**

16 A: I have identified three such problems. First, J.P. Morgan used .....  
17 .....  
18 .....  
19 .....  
20 .....

21 Second, J.P. Morgan appears to have omitted .....  
22 .....

23 Third, J.P. Morgan erred in modeling the Low Market Adjuster in the PPA.

24 **Q: How did J.P. Morgan err in modeling the Low Market Adjuster in the**  
25 **PPA?**

1 A: The Low Market Adjuster provides that, whenever the 12-month running  
2 average of actual ISO-NE market prices falls below 95% of the contract price, the  
3 PPA price will be reduced to 105% of the market price. "Market price" is  
4 defined as 110% of the average NEPOOL energy price for the month.<sup>16</sup>

5 The value of the LMA thus depends on the difference between the contract  
6 price and the forecast market price, and on the variability of the actual price  
7 around the forecast. J.P. Morgan estimated the value of the LMA with a Monte  
8 Carlo simulation. That is, J.P. Morgan ran .....random future market price  
9 forecasts through the LMA computation, selected the lower of the contract price  
10 or 105% of the market price for each month (depending on whether the LMA  
11 was triggered for the month), and averaged the results.

12 J.P. Morgan erred (1) in .....  
13 .....  
14 .....  
15 .....  
16 .....  
17 .....

18 **Q: Why does the forecast matter in the valuation of the LMA?**

19 A: A higher base-price forecast makes it less likely that the market price, when  
20 adjusted randomly, will fall below 95% of the contract price, triggering the  
21 LMA. Even if the simulated market price triggers the LMA, a higher base price  
22 forecast will result in a higher market price, reducing the value of the LMA.

---

<sup>16</sup>If a market for installed capacity is re-established, the market clearing price for capacity can replace the 10% adder on energy.

1    **Q: How did J.P. Morgan use monthly prices?**

2    A: Since the LMA is computed monthly, comparing the current contract price to the  
3       running 12-month average market price, J.P. Morgan modeled monthly market  
4       prices. ....

- 11 **Q: What was J.P. Morgan's error with respect to the variation in the actual**  
12 **price around the forecast?**  
13 A: The sort of analysis that J.P. Morgan performed requires that a standard  
14 deviation be applied to the forecasted price in a month, to produce a simulated

1 actual monthly price from that forecast monthly price. To estimate such a  
2 standard deviation, one might compare the price projected for a particular month  
3 in earlier forecasts to the actual price in the month, and compute the difference  
4 between the forecast price and the actual price. Using several forecasts of  
5 various vintages and the available data on market prices, one could determine  
6 the standard deviation of those differences. If it is reasonable to expect that the  
7 dispersion of future actual prices around the current forecast will be similar to  
8 the dispersion of actual market prices around the earlier forecasts, the standard  
9 deviation computed from the historical data can be used in evaluating the LMA.

10 J.P. Morgan's derivation of a standard deviation had no connection to the  
11 dispersion of actual prices around a forecast, and the resulting estimate is  
12 entirely irrelevant to the valuation of the LMA. Instead, J.P. Morgan computed

16 .....  
17 .....

18 .....  
19 .....  
20 .....  
21 .....  
22 .....

23 **Q: Were the choice of the winning bidder and the value of the sale affected by**  
24 **shortcomings in the auction process, the lack of response to the .....**  
25 **....., and problems in J.P. Morgan's evaluation of the bids?**

1     A:   Based on the information provided by the Petitioners, there is nothing to indicate  
2           that the auction process discouraged a potential higher bidder. There is no way  
3           of knowing whether the lack of .....resulted in any  
4           benefits being left on the table. Entergy was clearly the high bidder, but it is not  
5           clear .....

6           As a result, I cannot determine whether correcting J.P. Morgan's analysis would  
7           have changed VYNPC's decision.

8     **Q:   Does this conclude your testimony?**

9     A:   Yes.

### NOTES

<sup>a</sup>RSA.

<sup>b</sup>O&M support, net of property-tax support.

<sup>c</sup>Does not include buyback (value unknown).

<sup>d</sup>Compared to NRC benchmark.

<sup>e</sup>Refueling costs.

<sup>f</sup>Assumes minority shares of coal plants worth 70% of full control.

<sup>g</sup>No minority discount.
